The COVID-19 Case Iceberg

Infection fatality rate: 0.8%

For every single death we expect:
1 death = 125 infections
= 81 symptomatic + 44 asymptomatic

65% of infections are symptomatic
35% of infections are asymptomatic

In the United States, as of June 10th, we have identified 112,000 deaths from COVID-19

Which implies:
~14 million total infections

We have detected 2 million cases

Roughly 1 in every 7 who are infected

All figures are estimates as of June 10, 2020.

June 10, 2020 Adapted from RTSL and CDC estimates for COVID-19 in the United States.
